- ☒ Rally - Release
- ☒ Rally - Actual End Date
- ☒ Rally - Status
- ☒ Rally - % Complete
- ☒ Rally - Point Estimate
- ☒ Rally - Cost Estimate

Update Plan

The Problem Before Forge

Manual Effort

Project planning relied heavily on manual input, creating bottlenecks and increasing the risk of human error across delivery teams.

Disconnected Systems

Data lived across Aha, Rally, Optics, and Smartsheet with no unified view, forcing teams to reconcile information by hand.

Time-Consuming Planning

Creating and maintaining project plans consumed significant effort, slowing delivery and reducing team productivity.

Why Forge Was Created

Automation

Eliminate repetitive manual tasks in project plan creation and updates, freeing teams to focus on delivery.

Standardization

Enforce consistent planning structures and processes across all projects and delivery teams.

Visibility

Provide a single, reliable source of truth for project plans, timelines, and dependencies across the enterprise.

What is Forge?

Forge is an enterprise automation platform that connects delivery tooling standardizes project planning, and generates structured plans with minimal manual effort.

Automated Generation

Builds project plans from structured inputs and enterprise data.

System Integration

Connects Aha, Rally, Optics, and Smartsheet in a unified workflow.

End-to-End Visibility

Delivers a consolidated view of plans, status, and dependencies.

Is Forge Helpful?

Forge is primarily a rule-based automation platform rather than an AI-driven system. It automates project plan and test plan generation using predefined business rules, templates, mappings, filters, and integrations with Aha, Rally, and Smartsheet. While it significantly reduces manual effort, most decisions are deterministic and based on configured logic rather than machine learning or generative AI.

```
graph TD;
  A[Project Manager] --> B[Open Aha];
  B --> C[Open Rally];
  C --> D[Open Smartsheet];
  D --> E[Copy data manually];
  E --> F[Create test plan];
```

Forge End-to-End Workflow

Systems Integrated with Forge

Forge acts as the central integration hub, pulling data from and pushing updates to four key enterprise systems. This eliminates manual reconciliation and keeps all platforms synchronized in real time.

Project Plan Generation & Updates

How Plans Are Generated

01

Input Capture

User submits project details via Forge.

02

Data Enrichment

Forge pulls context from Aha, Rally, and Optics.

03

Plan Assembly

Structured plan generated in Smartsheet.

How Plans Stay Synchronized

01

Change Detection

Forge monitors source systems for updates.

02

Impact Analysis

Identifies affected tasks, timelines, and dependencies.

03

Auto-Sync

Propagates changes across all linked plans.

Business Benefits & Current Limitations

Benefits Delivered

- Reduced manual effort in plan creation
- Faster planning cycles across teams
- Standardized structures enterprise-wide
- Improved visibility and consistency

Known Limitations

- Some scenarios still require manual intervention
- Integration coverage is expanding but not yet complete
- Edge cases in plan generation need refinement
- Opportunity to further automate synchronization

Future Direction & Key Takeaways

Future Exploration Areas

These are **not** completed features — they represent areas of active research.

AI & LLMs

Exploring how large language models could assist plan generation.

Vector Databases

Investigating semantic search over historical project data.

RAG

Retrieval Augmented Generation for context-aware recommendations.

Future AI Roadmap

- A modern AI-powered Test Plan Generator might:
- Read project requirements
- Understand project context
- Search historical test plans
- Retrieve similar projects
- Generate new test cases dynamically
- Suggest risks automatically
- This would involve:
- RAG
- Embeddings
- Vector Databases
- LLMs
- Semantic Search
